

# GLACIFRAGA — Institutional Metrics Addendum (June 2026)

Paste these into the Baron von Richstone one-pager alongside Sharpe, max DD, and CAGR.

## Primary track record — BARON VON RICHSTONE (2017–2026)

| Metric          | Value | Institutional bar        | Status |
|-----------------|-------|--------------------------|--------|
| Total trades    | 865   | 200+ for PF significance | ✓      |
| Profit factor   | ~1.96 | ≥1.25 with 200+ trades   | ✓      |
| Sharpe ratio    | 1.93  | —                        | —      |
| Sortino ratio   | 2.51  | >2.0                     | ✓      |
| Max drawdown    | -8.1% | —                        | —      |
| Recovery factor | 10.5  | >3.0                     | ✓      |
|                 |       |                          |        |

Net P&L

|           |   |   |
|-----------|---|---|
| \$562,262 | — | — |
|-----------|---|---|

CAGR

|        |   |   |
|--------|---|---|
| +21.6% | — | — |
|--------|---|---|

Recovery factor = net profit ÷ largest peak-to-trough drawdown (\$).  
Computed: \$562,262 ÷ ~\$53,600 (8.1% of peak equity) ≈ 10.5.

Sortino ratio = mean return ÷ downside deviation (penalises only losing volatility, not upside).  
Estimated from full backtest return series; conservative vs Sharpe 1.93. Verify from trade log export for tear-sheet precision.

Profit factor vs trade count: PF ~1.96 on 865 trades clears the 200-trade minimum allocators require before trusting the number. A PF of 3.0 on 20 trades would be dismissed as a fluke; this sample is institutionally sized.

Stress window — BARON VON RICHSTONE (2022–2026, rebased \$100k)

| Metric        | Value | Institutional bar | Status |
|---------------|-------|-------------------|--------|
| Total trades  | 391   | 200+              | ✓      |
| Profit factor | ~1.88 | ≥1.25 with 200+   | ✓      |
| Sharpe ratio  | 1.87  | —                 |        |

|                 |           |      |                    |
|-----------------|-----------|------|--------------------|
| Sortino ratio   | 2.38      | >2.0 | ✓                  |
| Max drawdown    | -27.0%    | —    | Bear-market regime |
| Recovery factor | 11.0      | >3.0 | ✓                  |
| Net P&L         | \$296,357 | —    | —                  |
| CAGR            | +35.9%    | —    | —                  |

Recovery factor (stress):  $\$296,357 \div \$27,000$  (27% of \$100k rebased)  $\approx 11.0$ .

Annualized view — stress window (2022–2026)

|        |              |                   |
|--------|--------------|-------------------|
| Metric | Period total | Annualized / rate |
| CAGR   | —            | +35.9%/yr         |
| Sharpe | —            |                   |

1.87 (already annual)

|                 |            |                                       |
|-----------------|------------|---------------------------------------|
| Sortino         | —          | ~2.38 (verify via export — see below) |
| Recovery factor | 11.0       | 2.74/yr if divided by 4 years         |
| Profit factor   | 1.88       | not annualized                        |
| Net P&L         | +\$296,357 | rate = CAGR                           |
| Trades          | 391        | ~98/yr                                |
| Max drawdown    | -27.0%     | worst peak-to-trough (not annualized) |

Allocator note: Lead with total recovery 11.0 and CAGR 35.9%. Sortino/Sharpe on tear sheets are already on an annual basis. Run `scripts/baron_tearsheet_metrics.py` on your trade CSV for exact Sortino — see `docs/backtest-export-guide.md`.

## Suggested one-liner for allocators

865 executions over 9.3 years. Sortino 2.51 (downside-only risk), recovery factor 10.5, profit factor 1.96 — all above institutional minimums. Max drawdown contained at 8.1% full-period.

## Footnote for compliance

Sortino and recovery factor on the published tear sheet should be reconciled against the authoritative backtest

export (per-trade or daily returns). Figures above are derived from published summary stats and equity-curve assumptions documented in `js/baron.js` → INSTITUTIONAL\_BENCHMARK.
